

EPM Wizard

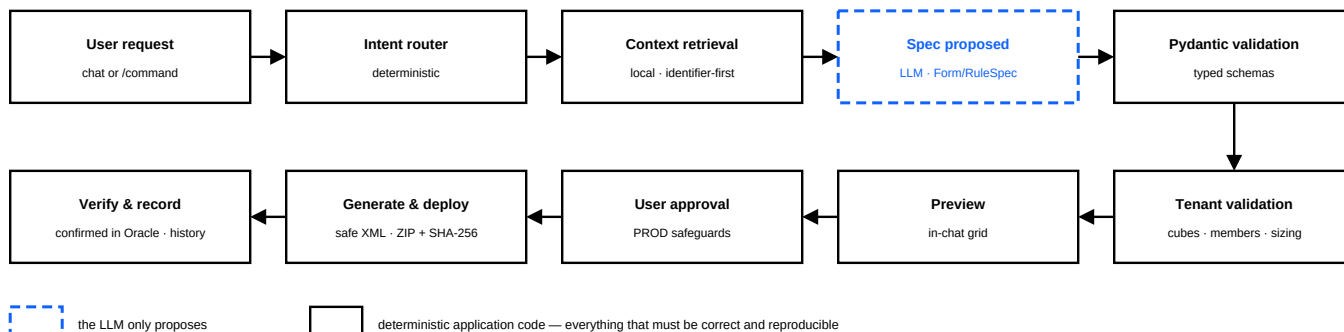

A local-first, ChatGPT-style AI workspace for Oracle EPM implementation — with an all-IBM Cloud hosted deployment path.

Build, validate, and deploy Oracle EPM artifacts from a chat interface. Runs entirely on your machine with **docker compose up** — zero config, no API key, IBM Carbon design.

What it does

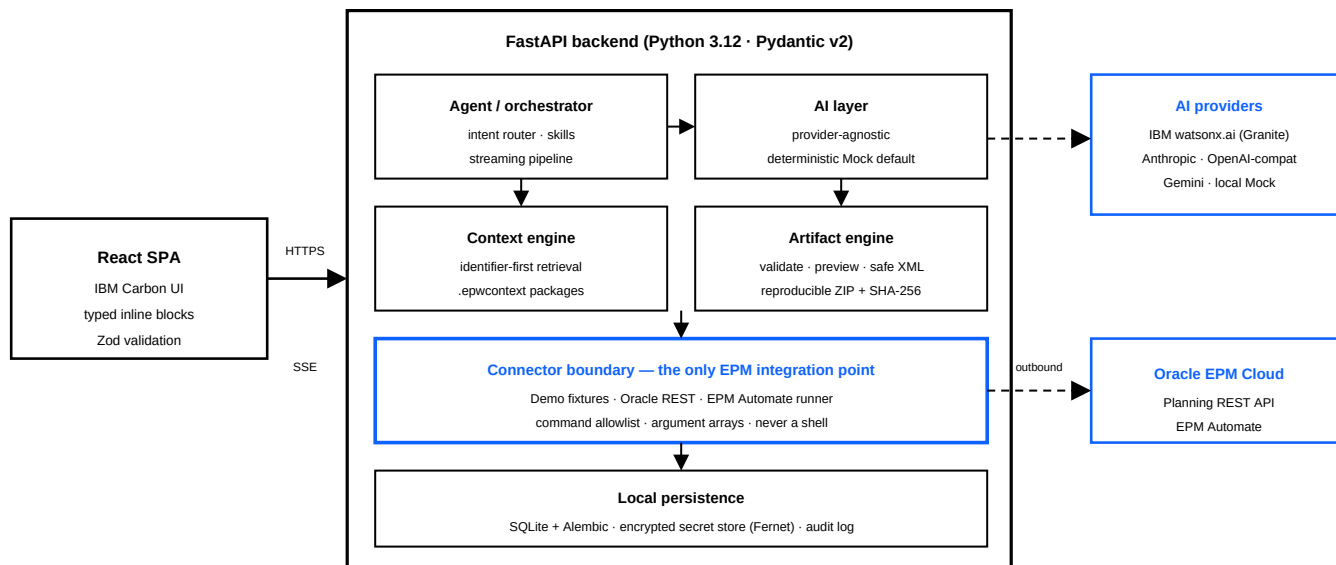

How a request becomes a deployed Oracle artifact

Security model

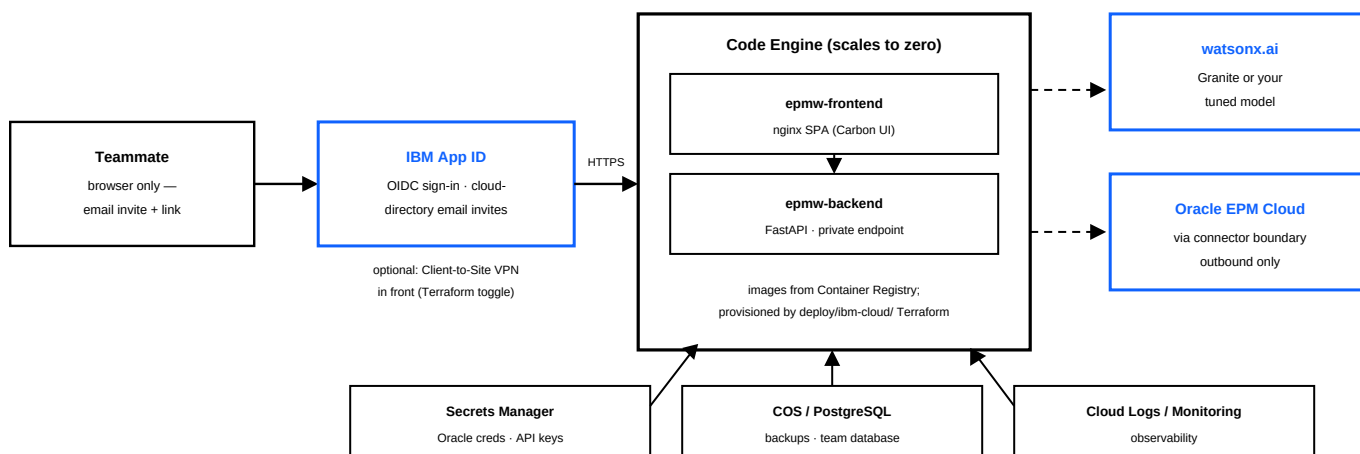

System architecture

React SPA + FastAPI over SSE. Pydantic owns the canonical schemas — TypeScript and Zod are generated from them (a CI drift test enforces it). The connector boundary is the only path to Oracle.

IBM Cloud deployment — implementation & goals

Goal: email invite + link → sign in → request to cloud. All IBM; local dev unchanged.

Training loop — your EPM data becomes a tuned Granite model
